--Abstract

The method is for nebulizing a patient. A nebulizer is provided that has an upper semi-spherical housing in operative engagement with a lower semi-spherical housing. The upper housing has openings to receive a tube that has an 10 upward opening defined therein. The nebulizer is connected to a respiration system downstream of incoming air of an inhale tube and upstream of a connector. The pressurized air is added in a tube connected to a bottom of the housing. The air is exposed to a liquid medication disposed in the housing. 15 The air aero-soles the liquid medication into an aero-soled medication. The aero-soled medication mixes with inhaling air provided by a ventilator unit and moisturized by an upstream filter. The aero-soled medication flows into the opening of the tube and then into a patient. --
